

Abstract of the Disclosure

Methods and apparatus are provided for highlighting one or more
5 selected objects in a raster image. A rasterizer renders base graphics data
containing a plurality of graphic objects to produce a base graphic raster.
When a user selects object(s), selection graphic data is generated. The
selection graphic data includes a selected graphic object corresponding to
the object(s) to be highlighted in the base graphic data. The rasterizer
10 renders the selection graphics data to yield a selection graphic raster.
The selection graphic raster and the base graphic raster are composited to
yield a graphic raster for display wherein the selected object(s) are
highlighted.
